Week 13

About the Final Exam

Joseph Vybihal  
Computer Science  
McGill University

Unix  
C + GNU  
HTML  
Perl  
Python

COMP 206 - Joseph Vybihal  
Software Systems

# Announcements

- Final exam tutorials
  - Will be posted on myCourses
- Sample final
  - Will be posted on myCourses
- Course evaluations
- Exam office hours
  - Tuesday and Wednesday at 3PM
  - Or, by appointment

Unix  
C + GNU  
HTML  
Perl  
Python

# About Final Exam

- 3 hours
  - Monday, December 18; 6:30-9:30pm
- Structure:
  - About 8 problems, no definitions
    - Command-line expressions
    - Bash programming X 1
    - GNU problems
    - C programming X 3

Unix  
C + GNU  
HTML  
Perl  
Python

# Type of questions

- Programming questions
- GNU case study problems

Unix  
C + GNU  
HTML  
Perl  
Python

# Topics on Exam

- C Programming
  - Pre-processor, struct, pointers, malloc, fork, fork & shell memory, fork & files, system, ~~linked lists~~, files, random files, extern, .h files, modular programming, functions, libraries, systems programming techniques, exit
- GNU Tools
  - Git, Make, GCC, GDB, GProf

Unix  
C + GNU  
HTML  
Perl  
Python

# How to Study

- Study:
  - Assignments, problems from textbook
  - Language syntax
  - Practice GNU Tools on Unix/Linux

Unix  
C + GNU  
HTML  
Perl  
Python

# Questions?

Unix  
C + GNU  
HTML  
Perl  
Python

# Problems

- C: Delete all occurrences of WORD in file
- C: Modular program with private array of grades  
Display the average grade
- C: An array of bank accounts, checking and savings, using struct and union, with functions deposit and withdraw.
- C: Using fork( ) search an array, using linear search, twice as fast

Unix  
C + GNU  
HTML  
Perl  
Python

# Additional Problems

## C

- Write the C program that can do this command line problem

`./calc 5 + 4`

The above C program displays 9 on the screen

Hint: `atoi()`, `argv[]`

- String manipulation in C. Assume a single string formatted using CSV (comma separated). It looks something like this: “a b c, d e f, g h i”. You are given a word, f. Is this word in the line? Which csv part of the line?

Hint: `strstr()`, loop with ptrs. Or: tokenizer and `strstr()`.

- `./copy word filename1 filename2`

Copy every line from filename1 into filename2 except those lines that have word in it.

- GDB: learn subset of commands, enough to know how to find an error.
- GPROF: learn how to read the summary and detail outputs

Perl  
Python

COMP 206 - Joseph Vybihal  
Software Systems

# Answers

Unix  
C + GNU  
HTML  
Perl  
Python

```
struct STUDENT
```

```
{  
    char *name;  
    char nameA[100];  
    int age;  
    double gpa;  
} s2[200];
```

```
Struct STUDENT s1[200];
```

```
scanf("%d",&x);
```

```
S1.name = (char *) malloc(x*sizeof(char));
```

```
*(ptr). == p-> (ptrs)
```

```
S1. (structures)
```

```
Wrong: scanf("%s",s1[5].name);
```

Unix  
C + GNU  
HTML  
Perl  
Python

```
struct STUDENT
```

```
{  
    char *name;  
    char nameA[100];           p++  
    int age;  
    double gpa;  
} s2[200];
```

```
Struct STUDENT s1[200], *p;
```

```
scanf("%d",&x);
```

```
p = (struct STUDENT *) malloc(x*sizeof(struct STUDENT));
```

```
P[3].age
```

```
*(p+3).age
```

```
struct STUDENT
```

```
{  
    char *name;  
    char nameA[100];  
    int age;  
    double gpa;  
    Struct STUDENT *next;  
} s2[200];
```

```
T = head;
```

```
T = t->next;
```

```
while(t != NULL && count<n)  
{  
    Count++;  
    printf("%d", t->age);  
    T = t->next;  
}
```

```
Struct STUDENT s1[200], *head, *t; // t means temp
```

```
head = (struct STUDENT *) malloc(sizeof(struct STUDENT));
```

```
head->next = (struct STUDENT *) malloc(sizeof(struct STUDENT));
```

```
head->next->next = NULL;
```

Unix  
C + GNU  
HTML  
Perl  
Python

```
P = malloc(3*sizeof(struct STUDENT));
```

```
Q = p + 1; /// p++
```

Unix  
C + GNU  
HTML  
Perl  
Python

```
c=fgetc(p);  
While(!feof(p))  
{  
    If (c=='.') count ++;  
    c=fgetc(p);  
}
```

```
int main(int argc, char *argv[])  
{  
    int count = 0;  
    FILE *p; char a[500];  
    If (argc != 2) exit(1);  
    P = fopen(argv[1], "rt");  
    If (p == NULL) exit(2);  
  
    fgets(a, 499, p);  
    While(!feof(p))  
    {  
        //for(i=0; i<499 && a[i]!='.'; i++);  
        for(i=0; i<499 && a[i]!='\0'; i++)  
        {  
            if(a[i]=='.') count++;  
        }  
        fgets(a, 499, p);  
    }  
}
```

Unix  
C + GNU  
HTML  
Perl  
Python

# Delete Word in File

```
char line[2000];
char *theWord="bob", *ptr, *ptr2;
FILE *inFile, *outFile;
inFile = fopen("infilename.txt","rt");
OutFile = fopen("outfilename.txt","wt");
if(inFile==NULL || outFile==NULL) exit(0);

fgets(line,1999,inFile); // get the first line
while(!feof(inFile))
{
    ptr = strstr(line,theWord);
    if (ptr != NULL) // found the substring
    {
        ptr2 = ptr + strlen(theWord); // past end of substring
        while(*ptr2!='\0') {*ptr = *ptr2; ptr++; ptr2++;}
        // we could have done: *ptr++ = *ptr2++; Crazy huh!
    }
    fputs(line,outFile); // copy to new file
    fgets(line,1999,inFile); // get next line
}
```

Python

# Private Array Module

```
int array[10];

void addValue(int x, int pos)
{
    if (pos >= 0 && pos < 10)
        array[pos] = x;
}
```

F1.c

```
// we respect the programmer of F1 by
// not inserting our own extern declarations

#include "F1.h"

int main(void)
{
    addValue(5, 9);
}
```

F2.c

```
void addValue(int, int);

// since we do not mention array
// as an extern it is private
```

F1.h
